Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. During the last few months I've been using Chrome for nearly every task I want to perform, both on Windows and Mac OS X. As much as I enjoy using Chrome on both platforms, I think they still have something to learn from each other, and I'd like to share my top 5 Chrome tips and tricks for Windows users. Tip 1: Tabs are on the left side Tabs are on the right in Chrome for Mac, and I liked that right away, so after a few weeks I started to use tabs the opposite way on Windows. As you can see, I just switched it back after I realized it's a pain. It's one of the first things I notice if I open a new tab, because I get used to it. After a few days I still feel more at home in the old version. If you're a Mac user, you've probably noticed that tabs on the left side, and the most important tool bar on the right. Tip 2: Keep the tab strip open The tab strip on Windows often takes the form of a smaller version of the tab list, and if you close the list too early you'll end up with the tabs in a smaller, almost useless form. At the same time, closing the list and keeping the tabs in the tab bar works, but I found it annoying as I couldn't easily scroll through the open tabs and find the ones I was interested in. I've tried lots of ways to solve this, but there was one that actually worked. Open any other tab, then go to the tab strip, and hold down the Ctrl key to keep the tabs open. After that, just right click the tab strip, select Close Tab Strip and it will close and keep the tabs in your original tab bar. Tip 3: Drag to close tabs If you're a Mac user, you know how to do this by default, but if you're using the Windows version you may not be familiar with it. To close a tab on Windows, right click and choose close tab. It opens a dialog where you can drag the tab to the left or right side of the window.
